Fixed Broadband Wireless Access in Vegetated Rural Residential Areas

Filesize: 6.4 MB

Reviews

Extensive information for publication fanatics. We have go through and that i am confident that i am going to likely to read through once more again in the foreseeable future. I am just very happy to inform you that here is the very best publication i have got go through in my individual lifestyle and might be he greatest ebook for ever.

FIXED BROADBAND WIRELESS ACCESS IN VEGETATED RURAL RESIDENTIAL AREAS

DOWNLOAD

Shaker Verlag Apr 2012, 2012. Taschenbuch. Book Condition: Neu. 211x149x15 mm. Neuware - This thesis discusses the propagation effects of fixed broadband wireless access systems in rural residential areas. The investigation is driven by a collaboration between industry and research institutes known as 'WiMAX in Niedersachsen', which aims to provide broadband wireless access via radiowaves to remote households in the rural villages in Germany. This thesis outlines an approach to model the digital map of a rural area by combining topography terrain data with clutter information derived by laser scanning. The inferred digital elevation model serves as a basis to include the environmental modelling for the propagation studies in rural residential areas. The primary propagation study stems from the analysis of crossseasons measurement data collected in the rural areas at 800 and 3500 MHz. In particular, the effects of antenna height, carrier frequency and seasons on large and small scale fading effects as well as outdoor-to-indoor penetration loss are quantified. The vegetation loss at 800 MHz and 3500 MHz are studied in this thesis. In particular, the discrete scattering theory from Foldy-Lax-Twersky is used to model the vegetation loss at 3500 MHz and this approach is known as Torrico-Lang model. At 800 MHz, the vegetation loss is modeled using diffraction theory with tree canopies serving as rounded partial radiowaves absorbers. This thesis proposes a simplified analytical propagation prediction model that is catered for a typical vegetated rural residential area by theoretically combining the distinctive propagation behaviours of radiowaves at 800 and 3500 MHz in the presence of vegetation. The analytical propagation prediction model is a realization of an idea proposed in literature as Torrico-Bertoni-Lang model. The inferred multi-screen diffraction model is an important extension to the Walfisch-Bertoni model and the Maciel-Bertoni-Xia model. The multi-screen diffraction model proposed in this thesis...
